

Benefits of LEAN Thinking

The five basic principles of Lean Thinking

1. Create value for your customer
2. Define the value stream that creates the value
3. Create flow in the value stream
4. Create pull (based on orders)
5. Continuous improvements

The reason why so many industries and companies implement LEAN is due to the remarkable benefits of LEAN. When the implementation is successful, the companies achieve considerable results and continuous improvements.

LEAN Thinking focuses on crea-

ting value for the customers and removing waste in the company; processes and activities which are not creating value for the customer are removed. This both concerns the production areas as well as the administration areas.

In many ways, LEAN Thinking

improves the working environment, and the company also achieves shorter delivery times for customers, a better delivery reliability, better quality, reduced stocks, higher productivity (minimum waste) etc.

Both internally and at the customers LEAN creates remarkable results. This is why so many companies implement LEAN!

LEAN with Logitrans products

As a consequence of the frequent implementation of LEAN, Logitrans experiences an increasing demand for equipment, organising the work flow in the most reasonable way. The focus is to avoid waste time and to protect the employees from inconvenient movements.

All the Logitrans products are designed to make the internal transport of goods as efficient as possible and to give the

employees ergonomically correct working conditions.

Logitrans has a large range of products with many options for this purpose. As an example the Logitrans highlifter can be mentioned; the highlifter can be used for both transportation of goods and as working table with an ergonomically correct working height.

The Logitrans products can also be tailor-made specifically to the application situation and requirements of the customer.

LEAN in the house of Logitrans...

Also in the house of Logitrans we focus on LEAN Thinking! All employees - in the production and in the administration - have been trained in LEAN.

All departments in the production area have been organised according to the LEAN tool for removing "waste", 5S (Sort, Set in order, Shine, Sustain and Standardize).

As an example, the contents

of 220 pallets was sorted and reduced to approx. 70 pallets! LEAN Thinking has also been

started up in the office area.

Team meetings every 14 days ensure that the objectives are fulfilled and that continuous improvements are made.

The employees are already now able to work more efficiently and make performance increase! This means improved job satisfaction and will in future result in improved delivery times!
